

The Map Function in R: Takeaways

by Dataquest Labs, Inc. - All rights reserved © 2020

Syntax

- Creating a custom function and using `map()` to vectorize it

```
format_score <-  
function(score) { fmt_string <- str_replace(score, "%", "") num <-  
as.numeric(fmt_string)  
return(num) }  
example_scores <- c("19%", "81%", "100%")  
map_result <- map(example_scores, format_score) `
```
- Using `map2()` to vectorize a function that takes in two inputs

```
first_inputs <- c(1, 2, 3)  
second_inputs <- c(4, 5, 6)  
add_inputs <- function(x, y) { return(x + y) }  
output <- map2(first_inputs, second_inputs, add_inputs) `
```
- Using the `map()` and `mutate()` functions to create a new column in your dataset

```
format_score <- function(score) { fmt_string <- str_replace(score, "%", "") num <-  
as.numeric(fmt_string)  
return(num) }  
scores <- scores %>% mutate( new_writing_score = unlist(map(writing_score,  
format_score)) ) `
```
- Using lists as an input to the `map()` function

```
input_list <- list( c(1, 2), c(3, 4), c(5, 6), c(7,  
8), c(9, 10) )  
output <- map(input_list, sum) `
```
- Using `group_by()` and `summarize()` together to vectorize a summary function across groups in a dataset

```
avg_score_by_student <- student_scores %>%  
  group_by(names) %>%  
  summarize(  
    avg_writing = mean(new_writing_score)  
  )
```

Concepts

- The `purrr` package has a family of functions that can accommodate any number of inputs and data types. Each of these functions work out similarly, so learning one can make learning the others easier.
- We use the `map()` function to vectorize a given function. You can use any function, whether it's one from R itself or a custom function that you've made yourself.
- We use the `map2()` function to vectorize a given function that uses two inputs.
- We can use the `group_by()` and `summarize()` functions together to create powerful analyses. These two work well when a dataset has two or more groups that we would like to compare against each other.
